Pancancer v3.13 (9 studies x 5 folds = 45 runs): the diversity PENALTY collapses ~20x on every run, but slot hazard variance stays BELOW its target band on 44/45 runs

Source: results/dct_v313_uni2h/<study>/<study>/.../epoch_curve_fold0..4.csv (45 runs). Faint lines = individual runs; bold = per-study mean.
READ (a) AND (b) TOGETHER: the pair-distance penalty is satisfied (a), yet per-slot risk spread stays below the v311 band (b).
Penalty satisfaction alone therefore does NOT certify slot diversity on its own.
