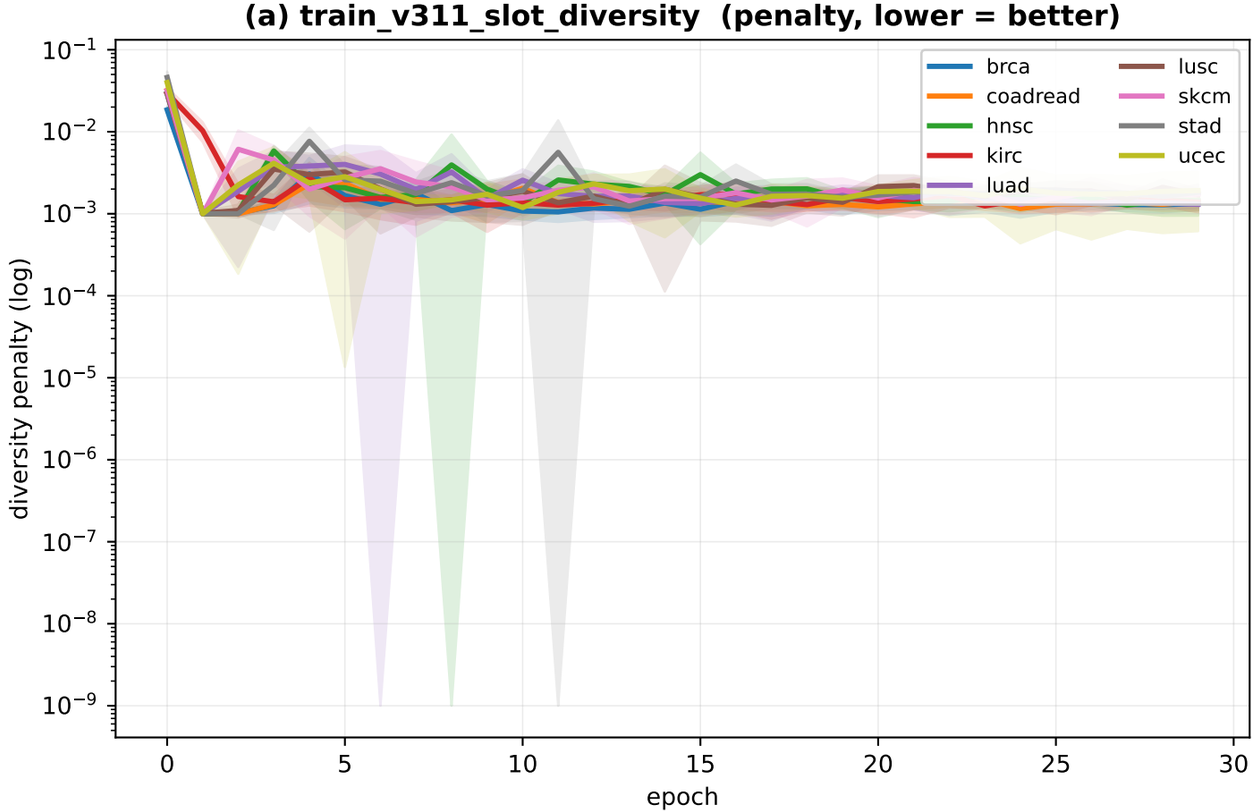
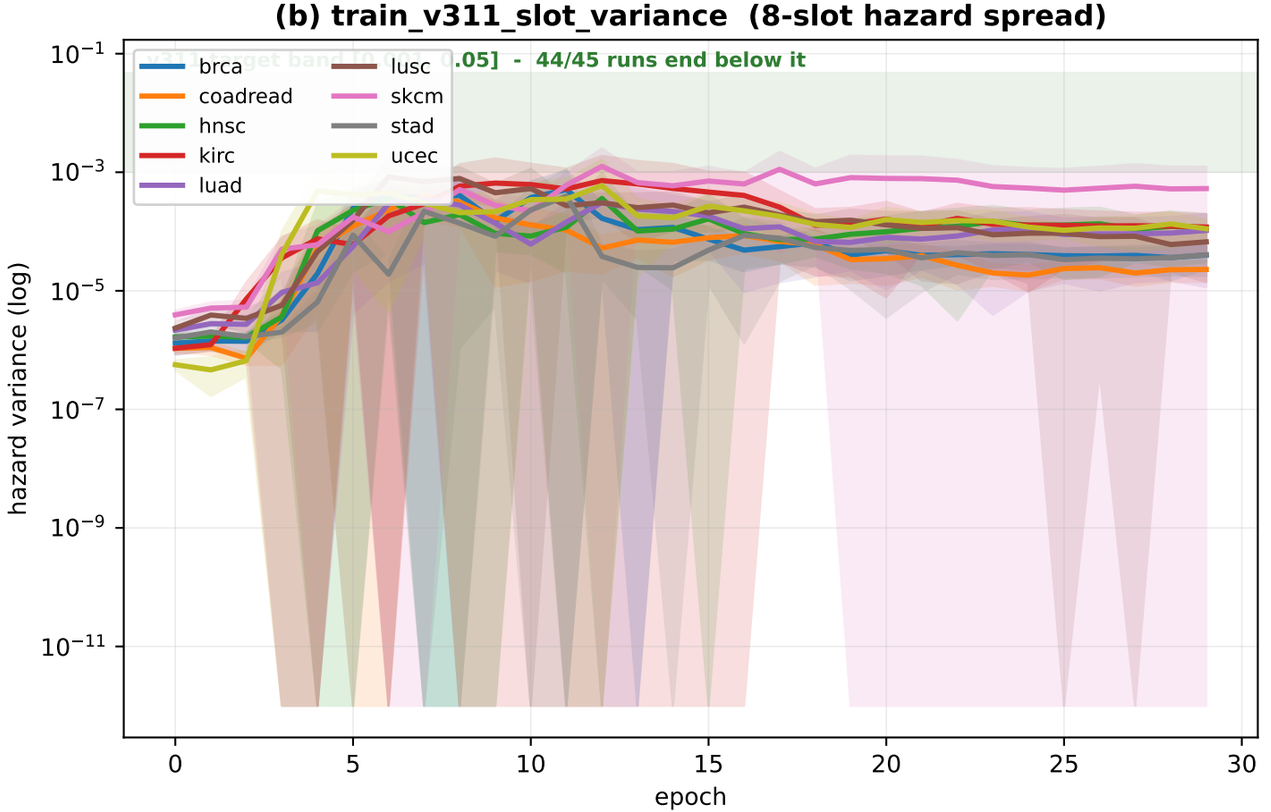
Pancancer v3.13 (folds collapsed within each study, 9 studies): mean +/- std across 5 folds





Source: results/dct_v313_uni2h/<study>/<study>/.../epoch_curve_fold0..4.csv. Bold line = mean across 5 folds; band = +/- 1 std.
Panel (a): all 9 studies drive the diversity penalty down by 14-27x.
Panel (b): every study's hazard variance ends below the v311 band - a gap the penalty does not close. Only skcm/fold2 reaches it.
