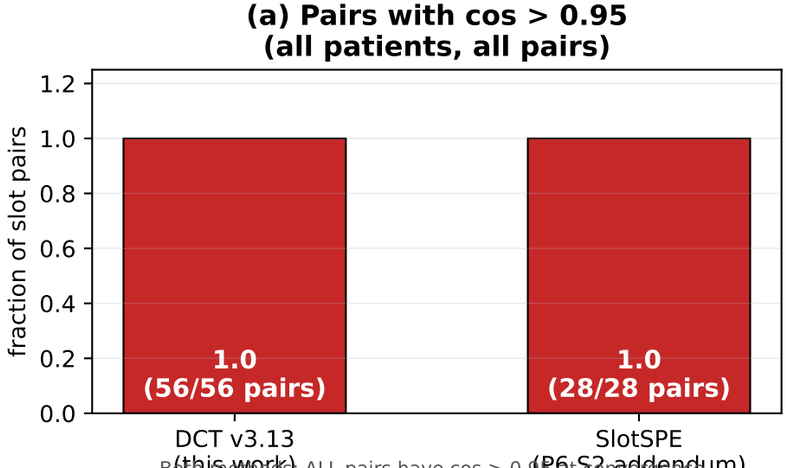
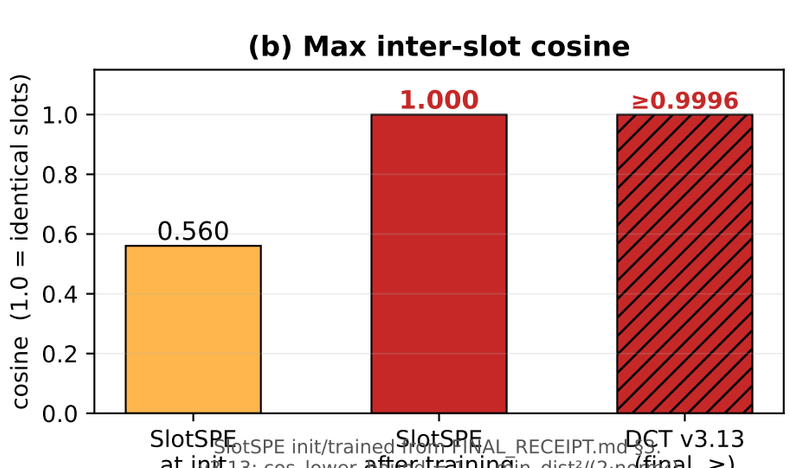
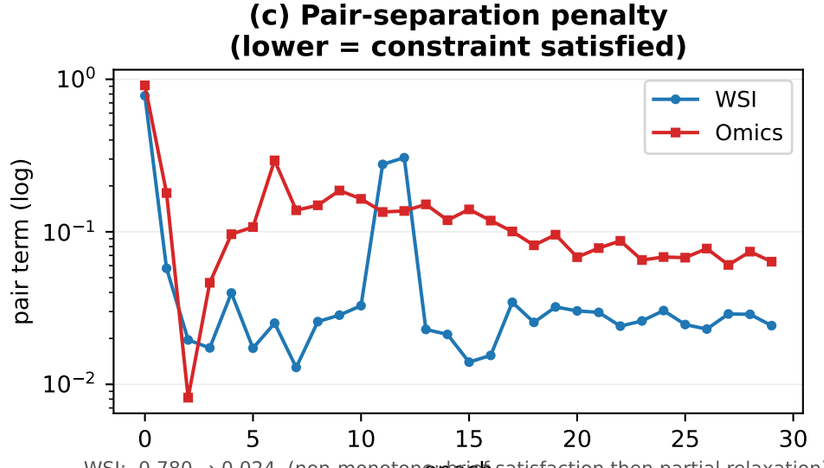
Slot redundancy (P2): Both methods have high slot cosine at convergence — but initial separation and mechanism differ



Both methods: ALL pairs have cos > 0.95 at convergence.
SlotSPE: S2 addendum, 77 val patients, 28 pairs each → 1.0
v3.13: min_pair_dist=0.51→cos≥0.9996 >> 0.95 → 56/56 = 1.0



SlotSPE init/trained from FINAL_RECEIPT.md §3.
v3.13: cos_lower_bound = 1 − min_dist²/(2·norm²)
= 1 − 0.509²/(2·18.8²) ≥ 0.9996.
Both final values ≈ 0.9996 — numerically similar at convergence.



WSI: 0.780 → 0.024 (non-monotone: brief satisfaction then partial relaxation)
OMIC: 0.912 → 0.0637 (monotone improvement)
The pair-term alone does not guarantee stable separation.
